1.0 INTRODUCTION

The rapid development of e-commerce has transformed how businesses and consumers interact, making sophisticated online shopping management systems more important than ever. These systems are critical for efficiently managing a variety of complicated operations, including order tracking, inventory control, customer data management, and payment processing. A strong database design adapted to an online shopping platform's individual requirements is critical for managing essential components such as product availability, customer information, and transaction processing. By properly organizing and handling large amounts of data, an efficiently designed database increases customer happiness, improves performance, and decreases errors. In addition, the system must include features such as a user-friendly interface, secure payment gateways, and scalable infrastructure to manage increased traffic and expanding product catalogs. Advanced analytics and reporting tools.

2.0 BACKGROUND STUDY

Online shopping management systems make it easier for people to buy and sell goods online, which benefits both businesses and consumers. User management, product management, shopping carts, order tracking, payment processing, and inventory control are just a few of the parts that make up this system. Businesses may improve client experiences, expedite processes, and securely handle transactions by incorporating these features, which will ultimately expand their market reach and boost revenues.

A well-structured database that arranges and maintains information on users, items, orders, and payments forms the foundation of a successful online shopping platform. Well-defined tables and relationships in relational databases, such as MySQL or PostgreSQL, help preserve data consistency and integrity. For instance, product tables handle inventory details, whereas user tables contain customer information. Effective data organization is ensured

by using the right normalization techniques, which also remove redundancy and enhance query performance.

Artificial intelligence integration for customized shopping experiences, mobile device optimization, and data analytics to comprehend consumer behavior are some recent developments in online shopping systems. To guarantee a seamless and safe purchasing experience, however, issues like data security, scalability, and speed optimization need to be resolved. Online shopping systems can help businesses succeed in a cutthroat market while offering consumers a smooth and pleasurable buying experience by fusing strong technology with well-designed databases.

3.0 PROBLEM STATEMENT

The current Shopping Management System struggles to attract and retain customers due to several design and functional flaws that hinder a positive user experience. The system features an outdated, cluttered user interface (UI) that is difficult to navigate and lacks visual appeal, making it frustrating for customers to find and purchase products. Additionally, the lack of personalization results in a generic shopping experience, with no tailored recommendations or suggestions based on users' preferences and habits. This is compounded by an inefficient search functionality that delivers inaccurate results and does not allow for effective filtering, forcing customers to spend unnecessary time browsing. The checkout process is another major pain point, as it is overly complex, involves too many steps, and lacks multiple payment options, leading to high cart abandonment rates. The system also fails to incorporate essential customer retention features, such as loyalty programs, personalized offers, or notifications that could engage users and encourage repeat purchases. Additionally, the weak integration with social media and the absence of a robust review system means that customers cannot easily share their purchases or rely on community-driven trust. Addressing these issues through a comprehensive UI/UX redesign, improved personalization, streamlined checkout would

significantly enhance the overall customer experience, boost retention, and increase sales conversions.

4.0 PROPOSED SOLUTIONS

Online shopping management system is designed to provide a seamless and user-friendly platform for customers to purchase and manage products online. This system provides a solution that allows users to shop from their homes without needing to travel to physical stores.

By offering a wide range of products and services at their fingertips, customers can easily choose what they need and compare the prices with physical stores. This system actually has a lot of features that can provide convenience to our customers. The system aims to create an engaging shopping experience, featuring intuitive navigation and a visually appealing interface that simplifies the search for desired items.

Furthermore, the platform integrates advanced features such as description of the products, efficient search and review and rating, and a streamlined checkout process, ensuring that users can complete their purchases quickly and securely. With multiple payment options and robust customer support, the Online Shopping Management System caters to the evolving needs of consumers, making online shopping not only accessible but also enjoyable.

On top of that, an online shopping management system will enable users to personalize their profiles including shopping history and wish list. Implement a persistent shopping cart that saves items for logged-in users across sessions. This will allow users to add or remove items from the cart easily. This kind of feature will be giving experience to the customer about how easily to buy a product in a short time.

Moreover, it enables users to view their order history and track the status of current orders. Provide admins with the ability to manage and track orders from the backend.

By focusing on these five core areas, the Shopping Management System will significantly improve user experience, streamline administrative tasks, and boost customer satisfaction. The integration of robust features such as a simplified checkout process, personalized product recommendations, and enhanced product reviews will help attract new customers while retaining existing ones.

4.1 Technical Feasibility Study

The technical feasibility study for the Online Shopping Management System focuses primarily on ensuring a secure and seamless login process. The system is designed to safeguard customer information through various security protocols. For instance, customer details will be automatically secured within the system, preventing unauthorized access. Users will have the flexibility to switch between accounts using email or other integrated platforms, such as social media logins (Google, Facebook), allowing for ease of use. In addition, customers will have the ability to edit their personal details, including their address, through a secure interface.

4.2 Operational Feasibility Study

The operational feasibility study for the Online Shopping Management System examines how well the system can function in real-world conditions, ensuring it meets the needs of both users and administrators while improving overall operational efficiency. First, the system will provide a smooth and user-friendly experience for customers. With features like personalized profiles, a persistent shopping cart, and easy access to edit personal information, users will find it convenient to browse, purchase, and manage their shopping. The inclusion of multi-platform login options (email, social media) will make the system accessible and simple to use, catering to a wide range of customers.

4.3 Economic Feasibility Study - CBA

ESTIMATED COST

Hardware	RM 25 000
Software	RM 7 500
Training	RM 15 000
Supplies	RM 7 500 per year
Maintenance	RM 5 000 per year
Salaries	RM 37 500 in year 1

ASSUMPTION COST

Discount rate	17 %
Annual change in salaries	5 %
Annual change in customer service	10 %
Annual changes in productivity	12 %

BENEFITS

Improve customer service	RM 43 000
Increase productivity	RM 43 000

COSTS	YEAR 0	YEAR 1	YEAR 2	YEAR 3
DEVELOPMENT COSTS				
· Hardware	25 000			
· Software	7 500			
· Training	15 000			
TOTAL	47 000			
PRODUCTION COSTS				
· Supplies		7 500	7 500	7 500
· Salaries		37 500	39 375	41 344
· Maintenance		5 000	5 000	5 000
Annual Production Costs		50 000	51 875	53 844
(Present Value)		42 735	37 895	33 619
Accumulated Costs		89 735	127 630	161 249

BENEFITS	YEAR 0	YEAR 1	YEAR 2	YEAR 3
Improve customer service		43 000	47 300	52 030
Increase productivity		43 000	48 160	53 939
Annual benefits		86 000	95 460	105 969
Present values		73 504	69 735	66 164
Accumulated benefits		73 504	143 239	209 403
Gain or loss		-16 231	15 609	48 154
PROBABILITY INDEX	1.02			

PROFITABILITY INDEX = $48154/47000 = 1.02$

Since profitability index = 1.02, showing that it is a good investment because of its index is more than one.

5.0 OBJECTIVES

- To design and develop a user-friendly and responsive online shopping website tailored to the shop's requirements.
- To create an easy-to-use interface that enables customers to browse, select, and purchase products.
- To help the shop owner increase sales by expanding the shop's reach beyond the physical shop.
- Create an efficient back-end system that allows the shop owner to easily manage inventory, process orders, and track customer data.
- To ensure that the website adheres to modern design and functionality trends that meet the needs of today's online shoppers.

6.0 SCOPE

The scope of this project defines the three primary entities involved in the online shopping management system: **Customers**, **Admins**, and **Product Management**. Each entity has specific roles and responsibilities within the system.

1. Customer:

Registration and Profile Management: Customers can register for an account using their email, contact number, or social media logins (e.g., Google, Facebook). They can update personal details such as their contact information, address, and preferences.

Browsing and Shopping: Customers can browse products categorized by type or brand, use search filters, and add products to their shopping cart or wishlist.

Order Placement and Tracking: Customers can place orders, choose a payment method, and track the status of their orders in real-time. They can also view their order history and request returns or cancellations.

Reviews and Feedback: Customers are allowed to leave product reviews and ratings after completing a purchase.

2. Admin:

User Management: Admins can view, update, or delete customer profiles. They can manage user permissions, including blocking or unblocking users as needed.

Product Management: Admins can add, update, or delete product listings. They are responsible for categorizing products, managing stock levels, and ensuring accurate product descriptions and pricing.

Order Management: Admins can view and manage all customer orders, including updating order statuses, handling returns or cancellations, and managing shipment details.

3. Product Management:

Inventory Control: The system will track real-time inventory levels for each product. Admins will receive alerts when stock levels are low or when a product is out of stock.

Product Listings: Products will be listed with all relevant details, including name, description, category, price, and available stock. Admins can modify these details as needed.

Product Performance: The system will track sales performance and provide insights on best-selling and low-performing products, allowing admins to make informed restocking decisions.

7.0 Project Planning

7.1 Human Resource

Figure 7.1 Human Resources for Online Shopping Management System

Figure 7.1 is an organizational chart that represents the structure of our group organization with the roles assigned to each team member.

7.2 Work Breakdown Structure (WBS)

Figure 7.2 Work Structure Breakdown for Online Shopping Management System

WBS is a fundamental tool in managing the project and helps to organize the project into a hierarchical framework of phases, activities, and tasks. In other words, the WBS is based on the System Development Life Cycle and structures a project from the top level to the most minute details. It helps in maintaining a scope that is very well defined and assures the coverage of whole projects to ensure that roles, responsibilities, and resources can easily be assigned to each and every part of it. In the case of such organization of projects, the WBS prevents scope creep but also acts like a roadmap in managing the tasks and ensures nothing gets left unaddressed. This is taken further when the WBS is combined with a Gantt Chart; visually, it adds a timeline to the structured tasks.

Where the WBS outlines what has to be done, the Gantt Chart can show when each should be completed by assigning start and end dates. Besides, the Gantt Chart shows the dependencies between tasks and provides an overview of the progress in clear detail, with every phase considered according to the deadlines of the project. Together, WBS and Gantt Chart offer a comprehensive system that will ensure timely delivery and better resource allocation through tracking and managing both the scope and schedule of a project.

7.3 Gantt Chart

8.0 Requirement Analysis (based from AS-IS analysis)

8.1 Current business process (scenarios, workflow)

CUSTOMER

1. User Registration and Authentication

Diagram 8.1.1: Customer Registration and Authentication

Customers must create an account to place an order by providing personal details like name, email, address, and payment information. They can access the registration page on the website, fill out the required form, and the system will store their information in the database. Once registered, users can log in using their credentials for future purchases.

2. Product Browsing and Searching

Diagram 8.1.2: Product Browsing and Searching

Users can browse products by category or use a search function to find specific items. They can either navigate through different product categories or enter a search query. The system will then retrieve and display a list of matching products from the database.

3. Product Details and Reviews

Diagram 8.1.3: Product Details and Reviews

Users can view detailed product descriptions, prices, customer reviews, and ratings to help them make informed purchasing decisions. By clicking on a product, they can access its full details. The system retrieves the product's information and customer feedback from the database for display.

4. Adding to Cart

Diagram 8.1.4: Adding to Cart

Users can add products to their shopping cart before proceeding to checkout. After selecting the desired quantity of a product, they click "Add to Cart." The system then updates the cart with the selected items and calculates the total cost.

5. Checkout Process

Diagram 8.1.5: Checkout Process

Users proceed to checkout by reviewing their cart and clicking "Checkout." The system then prompts them to provide shipping details and select a payment method. Once the payment is completed, the system generates an order number and adjusts the inventory accordingly.

6. Order Fulfillment and Tracking

Diagram 8.1.6: Order Fulfillment and Tracking

Once an order is placed, the system forwards the details to the warehouse for processing. The logistics team packs and ships the order. The system then updates the order status, and users receive notifications along with tracking information to monitor their delivery.

7. Customer Support and Returns

Diagram 8.1.7: Customer Support and Returns

Users can reach out to customer support for inquiries or to request returns and refunds. They can either submit a support request via the website or contact the support team directly. The system logs the request and alerts the support team, who then assist the customer with their concerns.

SELLER

1. Seller Registration and Login

8.1.8 Seller Registration and Login

For this process , the seller will create their account on an online shopping platform and after verification of business credentials is done , the seller will log in to their account using the details which are username and password.

2. Product Listing Management

8.1.9 Product Listing Management

Once the seller can sell their product, the seller will add products providing details such as name, product description and product materials. The seller also will update any information about the product specification and the price when needed. Online shopping management systems also can edit or want to remove the product when no longer available .

3. Inventory Management

8.1.10 Inventory Management

If the customer bought the product, the seller needs to check the quantity of the product. They also need to update after checking whether the product is still available in sufficient quantity, or It needs to be reordered from suppliers. If the product is out of stock , the system can mark it as unavailable for future purchases.

4. Order Management from customer

8.1.11 Order Management from Customer

In this part, sellers will receive notifications for new orders from the customer checkout. After they get the notifications, the seller will review the product ordered and confirm payments from the customer before proceeding to package and ship their item. If payment is confirmed, the seller will proceed with the customer's order and update shipping status until the order is delivered.

5. Payment Management

8.1.11 Payment Management

After payment is confirmed from the customer , seller will be notified of their messages . After a certain period , payment will be transferred to the seller's account and the order management will start. Once the product was delivered to the customer , customer will complain if their product was not in a good condition. Customer will do the request or return to the seller and seller will handle the refund and check the product whether in a good condition or not.

Review and rating

10.0 Transaction Requirement

10.1 Data Entry

1. User Information:

Input new user details such as:

1. Full Name
2. Email Address
3. Contact Number
4. Address
5. User ID

Record customer preferences like past purchases and wishlists.

2. Product Information:

Enter product details:

1. Product Name
2. Product ID (SKU)
3. Category
4. Price
5. Stock Quantity
6. Product description (e.g., size, color, brand)

3. Order Details:

Input order details including:

1. Order ID
2. Customer ID
3. Product IDs (for items ordered)
4. Order Date and Time
5. Shipping Address and Method
6. Payment Status (pending, completed)

4. Payment Information:

Enter payment details:

1. Payment ID
2. Payment Method (credit card, PayPal, etc.)
3. Payment Confirmation Status

10.2 Data Update/Delete

1. User Information:

Update or delete user details such as email, address, and contact number.

2. Product Information:

Modify product details like price, stock levels, or descriptions.

Delete discontinued products.

3. Order Information:

Update order details (e.g., shipping method, address).

Cancel or delete orders when needed (returns, cancellations).

4. Payment Status:

Update payment status when processed (from pending to completed).

Delete payment records if refunds or failures occur.

10.3 Data Queries

1. Customer Orders:

Retrieve all orders placed by a specific customer, with order details and statuses.

2. Product Availability:

Query for available products by category or brand for inventory management.

3. Order Status:

Display order status (pending, shipped, delivered, cancelled) by order ID.

4. Stock Level Monitoring:

Query low-stock products to trigger restocking alerts.

5. Payment History:

Retrieve payment transactions linked to a specific customer or order.

11.0 BENEFIT AND SUMMARY OF PROPOSED SYSTEM

The online shopping management system is designed to simplify and improve key business processes such as product management, order processing and customer service. By implementing features like an enhanced product browsing experience, an automated inventory system and integrated payment gateways, the system will be efficient, improve user experience and drive sales. Additionally, the system will greatly reduce manual management tasks and errors by combining multiple components into a single platform, including user profiles, shopping carts, payment gateways, and review systems. The shop owner will be able to make better business decisions by using real-time data insights to make well-informed decisions about inventory, product performance, and customer preferences.

Overall, the digital system will improve both the customer's shopping experience and the shop owner's operational efficiency. By adopting a modern e-commerce platform, the shop will not only meet current online shopping expectations but also position itself for sustainable growth and increased customer retention.

Customer's benefits:

- More convenience (have personalized product recommendations)
- Improved product search with advanced filters
- Flexible payment options (e.g. digital wallets, credit/debit cards)
- Real-time order updates
- Better decision-making before purchasing (customers allow to see reviews did by other customers)

Shop Owner's benefits:

- Automated stock management
- Real-time data insights into top-selling products and customer preferences.
- Streamlined order handling
- Personalized customer profiles and purchase history.
- Lower cart abandonment rate

12.0 QUESTIONNAIRE

Based on the responses from 20 participants, here's a detailed analysis of the online shopping management system

How often do you use online shopping system?

19 responses

The data on the frequency of online shopping reveals that the majority of the respondents (68.4%) shops in a month, a smaller percentage of them (26.3%) shops in a week and only one respondent (5.3%) shops in a day. This means that the platform is mainly targeted to a very narrow range of users who can be classified as occasional or moderate shoppers and thus they need to be taken care of. There are also additional elements that are introduced to the platform to reduce latency for injecting engagement of less frequent shoppers such as promotions or reminders aimed at increasing the interaction within the platform.

Do you think online shopping is better than pyhsical shopping ?

19 responses

Considering online shopping versus physical shopping, 89.5% of the respondents prefer online shopping, whereas the percentage of those who prefer physical shopping is 10.5%. This shows a very positive attitude towards online shopping and could mean further developments since the conveniences and accesses to shop online mean a lot for the users. The remaining 15% did not mention their preference, but the majority clearly supports the online experience of the platform over physical stores.

How easy is it to navigate through the website or app?

19 responses

In terms of the ease of navigation, 57.9% of the respondents rated it 4/5, while 36.8% rated it a perfect 5/5, which shows that the platform is quite easy to use. However, one of the respondents rated the navigation as 3/5, revealing that they found the user interface and layout comprehension a bit challenging and needed to be enhanced. Further improvement of these ratings could be achieved by improving the overall navigation. For instance, by making it more straightforward or enhancing the search capabilities.

Did you encounter any issues during the checkout process? (If 'Yes' , describe the issues)

17 responses

No
no
Yes when do the transaction
Slow when i want to pay
Nope
Yes , why do i have probem to pay the product during live session ?????
Yes. Payment method
Yes,don't know the product quality

As many as 45% of users complained about issues in checkout, citing slow transaction processes and difficulties during live shopping sessions. Whereas 55% of the respondents reported no problem with the checkout process, this other group experienced enough issues to be considered worthy of attention. Smoothening the checkout experience, in particular, making it speedy and smooth in terms of payment, would minimize frustration and thus prevent abandonment.

Were the product descriptions and images helpful in making purchasing decisions?

19 responses

The product descriptions and photos were appreciated in general period 94.7% of customers found them useful in making purchasing choices. This indicates that the current display of products is of good quality. Nonetheless, a small number of people (5.3%) expressed dissatisfaction, which stresses the need for always giving concise and straightforward explanations to avoid ambiguity or discontent.

How satisfied are you with the payment options provided?

19 responses

Regarding the payment option, 42.1% gave full satisfaction with a rating of 5/5, while 36.8% rated it 4/5. However, 21.1% gave a rating of 3/5 to show their satisfaction level. This means that even though users are satisfied on the whole, there is still room for improvement. Probably, providing more options to make the payment or simplifying the process might improve this average level of satisfaction.

The respondents also put forward various proposals for enhancements. Among the major improvements was the use of artificial intelligence to assist customers to find products, the introduction of 3D forms of products, and the ability to track shipments in real time. Some of the respondents also asked for faster delivery options like same day delivery, and extra coupons other than those given for purchases. These recommendations suggest a willingness to improve the efficiency of the system as well as the enjoyment of the users. The use of artificial intelligence was necessary, in order to enhance the processes of personalization and control of delivery and tracking processes.

In conclusion, the platform is appreciated and presents a high inclination toward online buying and satisfaction with product display. However, concerns do arise regarding the checkout process and the payment options. Rectifying these issues and embracing suggestions like AI product suggestions, better user interface performance, and package tracking can significantly enhance user experience and increase engagement levels.

13.0 SUMMARY

Our team has gained valuable insights into the current online shopping management system by carefully analyzing its workflows, inefficiencies, and overall functionality. Through this process, we identified key challenges, such as poor user experience, inefficient inventory management, and cumbersome checkout procedures, which have informed our proposed solutions.

We investigated the project from various perspectives, conducting technical, operational, and economic feasibility studies to ensure that the system can be realistically implemented and maintained. In addition, we've outlined clear project objectives, carefully planned out resources, and developed a Work Breakdown Structure (WBS) and Gantt chart, DFD diagram to guide us through the next steps.

By performing an in-depth AS-IS analysis, we've documented the current business processes, including scenarios and workflows, which provided a better understanding of the system's transaction requirements, such as data entry, updates, deletions, and queries. This analysis has highlighted areas where improvements can be made and how our new system can offer a more streamlined, scalable solution. We also do questionnaires to do research in the community to make sure the system is more aligned to customers requirements.

Overall, this requirements-gathering process has provided us a strong foundation to move forward with the design and implementation of a customized online shopping management system. The insights gained from our analysis will guide us as we work towards creating a more efficient, user-friendly platform that meets both the operational needs of the shop owner and the evolving expectations of customers.
